sanfrancisco_incidents_summer_2014
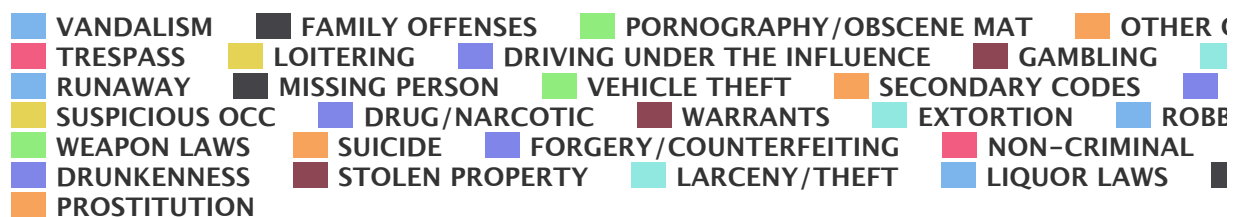

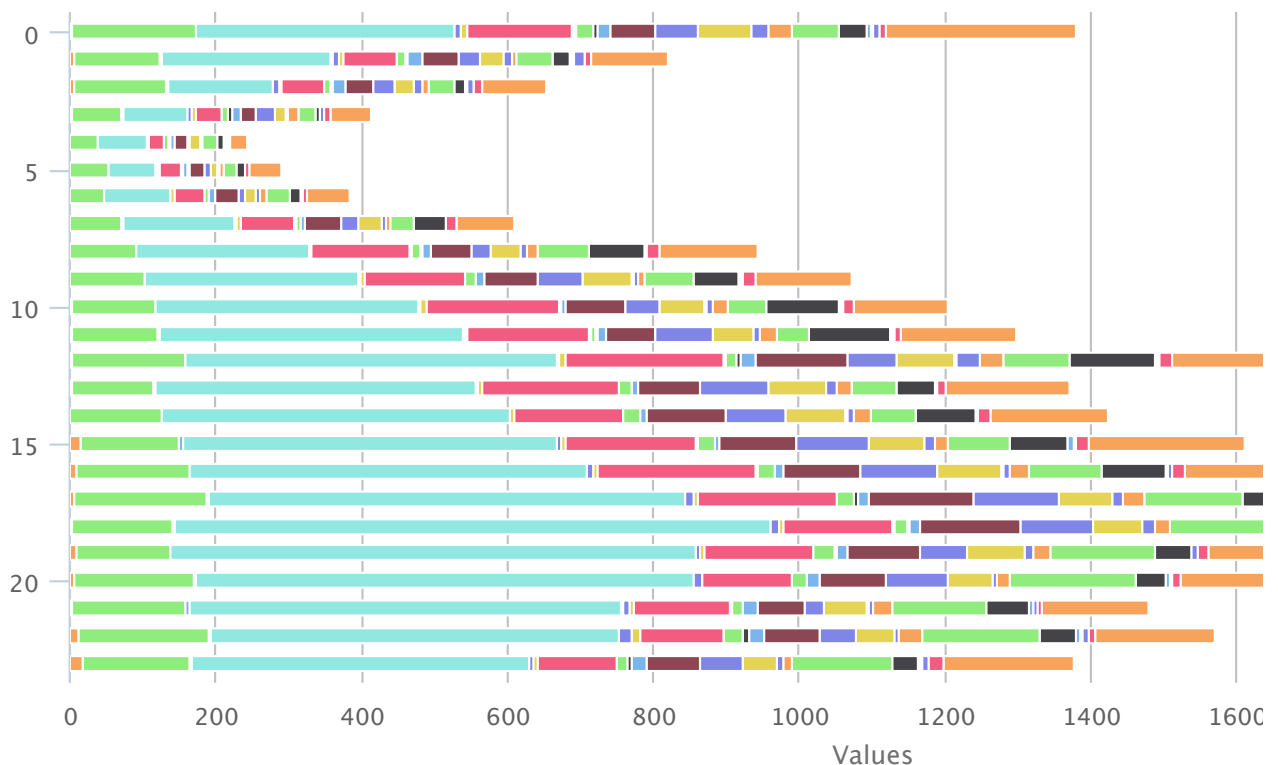

Sanfrancisco incidents data in summer 2014

Graph explain:

- Below barchart shows how many insidens happen in each of time.
- Y axis is time and the values are 0 - 23. X axis is number of insidens.

My thought from graph:

- Basically number of insidents has corelation with human activity.
- In early morning such as 3-6am insidents don't happen so much than noon or evening.

Graph explanation:

- Below barchart shows how many rate of each insidents in each times.

My thought:

- One thing we can see is ratio of "ASSULT" is high in 2-5am.
